The Internet: Are Children Smarter Because of It?

In the world today, technology is everywhere, and the Internet is a major part of our lives. Almost everything we do in our daily lives has to do with the computer or some sort of technology in one way or another. Children nowadays are starting to use technology at younger age. There are a lot of children with tablets or iPods, which they use daily. So this brings to mind, are children smart or more socialized because of the internet?

By engaging their brains in more complex tasks at a younger stage in their lives, toddlers are improving cognition and critical review skills, and displaying a more advanced understanding of both virtual and real worlds. There is a whole other side to this question also, that the information on the internet has always been readily available, so what is it about the internet that is making children smarter. If it has always been available and they did not make the effort to use it then, they are not going to use it now. In a way the internet can also be a distraction to children because the social media sites are easily accessible. They say children are not able to retain as much information as before because the internet has such easy access to questions. So students/children are not taking their time and giving thought into their projects. It is so easy to just look up an answer and pop it in, than to give it thought and personal reflection. And if the students are just using Google, than are they really retaining the knowledge they are seeking?
